Assumptions

- In our model, we assume that LGA record when minimum there is one branch and here, we do not record when there is no branch because it leads to unwanted database consumption.

- In the loan entity, with given client information we assumption due date, which is calculated 2 weeks from the loan date, when book is taken.

- With given client information, we assumed that a manager is assigned at least one branch and in few cases a manager can manage many branches.

- With information from our client, we designed our model like A borrower to take more than one book at a time, but each book is recorded as a separate loan in our model and, we are recording each loan separately.
